#### ULI101: INTRODUCTION TO UNIX / LINUX AND THE INTERNET

WEEK 6: LESSON I

LINKING FILES

PHOTOS AND ICONS USED IN THIS SLIDE SHOW ARE LICENSED UNDER CC BY-SA

# LESSON I TOPICS

### **Linking Files**

- i-nodes
- Hard Links / Demonstration
- Symbolic Links / Demonstration

#### **Perform Week 8 Tutorial**

- Investigation I
- Review Questions (Questions I 2)

### Perform Assignment 2

Section 4: Linking Files and Directories

#### inode (index) Number of a File:

The **i-node number** is like a "**fingerprint**" which is **unique** for each file on a Unix / Linux file system.

The i-node is an **index** (**data structure**) that provides information about the file such as if the file is a **directory** or **regular file**, etc.

Referring to the diagram below, issuing the **Is** command using the **-i** option displays the **i-node** number for each file. You can see that <u>each</u> file has its own **unique** *i-node* number in the file system.

```
[ murray.saul ] ls -li
total 0
1162999961 -rw-r--r-- 1 murray.saul users 0 Jan 31 07:26 a.txt
1164541350 -rw-r--r-- 1 murray.saul users 0 Jan 31 07:26 b.txt
1165743019 -rw-r--r-- 1 murray.saul users 0 Jan 31 07:26 c.txt
2248130583 drwxr_xr-x 2 murray.saul users 6 Jan 31 07:26 mydir
```

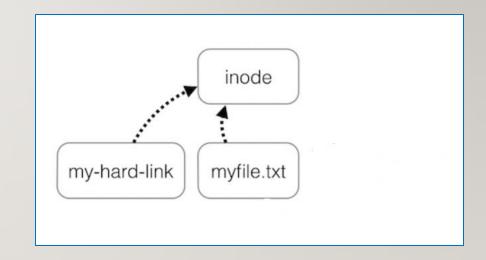

#### **Hard Links**

A **Hard Link** is a **reference** to the **same index** on a file system. It does this by creating a file that **shares the same i-node number** with the other file.

An **advantage** of using hard links is that if one hard link remains (even if original file has been removed), **the data in that hard-linked file is NOT lost**. Also, any change to either file will be reflected in any hard-linked file which is useful for **backups**.

Limitations of hard links are that they take-up extra space, you cannot hard link directories. Also, you cannot hard link files from other Unix/Linux servers (since the i-node number is unique to that filesystem).

#### **Hard Links**

#### Examples:

```
touch myfile.txt
ln myfile.txt myfile1.hard.lnk
ln myfile.txt myfile2.hard.lnk
ln myfile.txt ~/backups/myfile.hard.lnk
ls -li myfile*
```

```
[ murray.saul ] pwd
/home/murray.saul/link-demo1
[ murray.saul ] touch myfile.txt
[ murray.saul ] ln myfile.txt myfile1.hard.lnk
[ murray.saul ] ln myfile.txt myfile2.hard.lnk
[ murray.saul ] ln myfile.txt ~/myfile3.hard.lnk
[ murray.saul ] ls -li . ~/myfile3.hard.lnk
3261599590 -rw-r--r-- 4 murray.saul users 0 Feb 3 08:39 /home/murray.saul/myfile3.hard.lnk
.:
total 0
3261599590 -rw-r--r-- 4 murray.saul users 0 Feb 3 08:39
3261599590 -rw-r--r-- 4 murray.saul users 0 Feb 3 08:39
3261599590 -rw-r--r-- 4 murray.saul users 0 Feb 3 08:39
3261599590 -rw-r--r-- 4 murray.saul users 0 Feb 3 08:39
```

## **Instructor Demonstration**

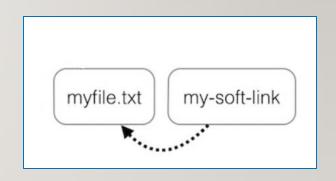

Your instructor will now demonstrate how to create Hard Links.

# **Symbolic Links**

A **Symbolic Link** is an **indirect pointer** to a file and is also known as a **soft link** or **symlink**. The symbolic link file contains the **pathname to** to the original file.

An **advantage** of using symbolic links is they act as **shortcuts** to other files (in fact, the symbolic linked file only contains the pathname to the original file). Also, you can create symbolic links on **different** Unix/Linux servers, and that you can create symbolic links for **directories**.

A limitation of using symbolic links is that they are **NOT** good for backup purposes since a symbolic link can point to a **nonexistent** file (referred to as a "broken link").

# **Hard Links vs Symbolic Links**

Hard Link		Symbolic Link
inode: 1110214466		inode: 1110214466
/	1	
1	1	
I	1	V
~/very/long/path/file1.txt	~/file2.txt	~/very/long/path/file1.txt
		V
		~/file2.txt

## **Symbolic Links**

#### Examples:

```
touch otherfile.txt
ln -s otherfile.txt otherfile1.sym.lnk
ln -s otherfile.txt otherfile2.sym.lnk
ln -s otherfile.txt ~/backups/otherfile.sym.lnk
ls -li otherfile*
```

```
[ murray.saul ] pwd
/home/murray.saul/link-demo2
[ murray.saul ] touch otherfile.txt
[ murray.saul ] ln -s otherfile.txt otherfile1.sym.lnk
[ murray.saul ] ln -s otherfile.txt otherfile2.sym.lnk
[ murray.saul ] ln -s ~murray.saul murray
[ murray.saul ] ls -li
total 0
3267712746 lrwxrwxrwx 1 murray.saul users 17 Feb 3 09:08 murray -> /home/murray.saul
3267712744 -rw-r--r-- 1 murray.saul users 0 Feb 3 09:08 otherfile.txt
3267712742 lrwxrwxrwx 1 murray.saul users 13 Feb 3 09:08 otherfile1.sym.lnk -> otherfile.txt
3267712745 lrwxrwxrwx 1 murray.saul users 13 Feb 3 09:08 otherfile2.sym.lnk -> otherfile.txt
```

### **Instructor Demonstration**

Your instructor will now demonstrate how to create Symbolic (Soft) links.

## **Getting Practice**

To get practice to help perform Assignment #2, perform Week 8 Tutorial:

- INVESTIGATION I: LINKING FILES
- LINUX PRACTICE QUESTIONS (Questions I 2)

#### **Perform Assignment 2**

• Section 4: Linking Files and Directories
