## ULI101: INTRODUCTION TO UNIX / LINUX AND THE INTERNET

WEEK 10 LESSON I

THE SED UTILITY

PHOTOS AND ICONS USED IN THIS SLIDE SHOW ARE LICENSED UNDER CC BY-SA

# LESSON I TOPICS

## The sed Utility

- Definition / Purpose
- Usage
- Using sed as a Filter with Pipeline Commands
- Demonstration

#### **Perform Week 10 Tutorial**

- Investigation I
- Review Questions (Parts A and B)

## **Purpose**

The **sed** command stands for **Streaming Editor**.

The sed command is used to **manipulate text** that is contained in a **text file** or via a **pipeline command**.

Although the sed command does NOT change content <u>inside</u> a text file, this command acts like a "on-the-fly" text editor to display modified text on the **screen**, **redirect** to a file or act as a **filter** within a pipeline command.

## Usage:

sed [-n] 'address instruction' filename

## How it Works:

- The sed command reads **all lines in the input file** and will be exposed to the expression (i.e. area contained within **quotes**) one line at a time.
- The expression can be within single quotes or double quotes.
- The expression contains an address (match condition) and an instruction (operation).
- If the line matches the address, then it will perform the instruction.
- Lines will display be default unless the -n option is used to suppress default display

## Usage:

```
sed [-n] 'address instruction' filename
```

#### **Addresses:**

- Can use a line number, to select a specific line (for example: 5)
- Can specify a range of line numbers (for example: 5, 7)
- Regular expressions are contained within forward slashes
   (e.g. /regular-expression/)
- Can specify a regular expression to select all lines that match a pattern (e.g /^[0-9].\*[0-9]\$/)
- If NO address is present, the instruction will apply to ALL lines

## Usage:

sed [-n] 'address instruction' filename

## **Common Instructions:**

- p Print lines that match the address (commonly used with -n option)
- **d** Omit (**delete**) display of lines that match the address
- q Print lines including line that matches address and then quit processing
- **s** Substitute text to replace a matched regular expression (similar search and replace)

#### Example I

The following sed command line displays all lines in the readme file that contain the word **line** (all lowercase).

In addition, because there is no -n option, sed displays all the lines of input.

As a result, sed displays the lines that contain the word line twice.

# sed '/line/ p' readme Line one. The second line. The second line. The third. This is line four. This is line four. This is line four. Five. This is the sixth sentence. This is line 7. This is line 7. Eight and last.

Unless you instruct it not to, sed sends **all lines**, selected or not to standard output.

When you use the -n option on the command line, sed sends only those lines to stdout that you specify with the print p command

## Example 2

The following sed command displays contents of a file from a **range** of line numbers.

sed -n '3,6 p' readme
The third.
This is line four.
Five.
This is the sixth sentence.

The print p instruction using the -n option only displays lines 3 through 6.

## Example 3

The following sed command displays the <u>first</u> **five** lines of text just as **a head -5** lines command would.

#### sed '5 q' readme

Line one.
The second line.
The third.
This is line four.
Five.

The sed command prints **all lines**, beginning from the first line, In this example, sed will **terminate** when **line 5** is matched.

#### Example 4

The following sed command displays a **TAB** character for lines contained in a file.

```
$ sed 's/^./\t&/' readme
Line one.
The second line.
The third.
etc...
```

The replacement string (between the second and third forward slashes) contains a backslash escape sequence that represents a **TAB** character (\t) followed by an ampersand (\(\&\)).

The **ampersand** character (§) takes on the value of what the regular expression matched.

## Example 5

The following sed command uses a **regular expression** and the **quit** instruction.

```
sed '/[0-9][0-9][0-9]$/ q' myfile
sfun 11
cool 12
Super 12a
Happy112
```

The regular expression in the following expression [0-9][0-9][0-9] matches **three digits** at the <u>end</u> of a line.

The command will process the file, one-line at a time, beginning at the top and (by default) outputting each line to standard output.

Once the regular expression is matched, it will display the matched line and stop processing the sed command.

## Using sed Utility as a Filter with Pipeline Commands

Although sed can be used as a streaming editor for text contained within a text file, the sed command can also be used as a **filter** within a **pipeline command**.

#### **Examples**

```
ls | sed 's/^[0-9]/x/g'
echo "I like Linux" | sed 's/ /,/g'
```

#### **Instructor Demonstration**

Your professor will demonstrate additional examples using the **sed** utility.

#### Pathname of cars database:

~murray.saul/uli101/cars

#### Commands

```
sed -n '3,6 p' cars
sed '5 d' cars
sed '5,8 d' cars
sed '5 q' cars
sed -n '/chevy/ p' cars
sed '/chevy/ d' cars
sed '/chevy/ q' cars
sed 's/[0-9]/*/' cars
sed 's/[0-9]/*/' cars
sed 's/[0-9]/*/g' cars
sed '5,8 s/[0-9]/*/' cars
sed '5,8 s/[0-9]/*/' cars
```

#### Contents of cars database file:
